I build products people trust with their money — from fintech flows used by 10M+ people to a marketplace I took from zero to revenue.

Open to international roles · Remote / Hybrid / On-site · Fluent English

10M+

users on flows I own

250

transactions in XPCard's first 3 months, \$0 marketing

5+

years in fintech frontend

14

shared npm packages shipped

Software engineer with a front-end core who can carry a product end to end. For five years I have built and led the Credit & BNPL frontend at Digipay — Iran's largest digital-payments platform — where the screens I own are used by more than 10 million people. In 2026 I founded XPCard and built it from scratch on my own, from architecture to production, using an AI-agent workflow I designed while keeping architecture, code review and releases in my hands. It processed 250 transactions in its first three months with zero marketing spend. I am looking for an international team to do my best work with.

01 EXPERIENCE

XPCard (xpcard.ir)

Jul 2026 – Present

Founder & Software Engineer

Tehran · Remote

Angular 20

Nx

Spring Boot 3

Java 21

MySQL

MongoDB

Redis

Docker

WordPress

Claude Code

- ▶ Founded and built from scratch, as the only engineer, a live marketplace for gift cards, game accounts and game top-ups: customer storefront, admin dashboard, backend, Telegram bot and an SEO content site, all shipped to production in about three months.
- ▶ Reached 250 transactions in the first three months with zero marketing spend. Traffic came from organic search, driven by a WordPress magazine and technical SEO work that I built and ran.
- ▶ Designed the system architecture and an AI-assisted delivery workflow around it. I own the product decisions, the architecture, the API contracts and the final review of every change, and AI agents do the repetitive implementation, test and verification work inside guardrails I defined.

- 01 Architected a four-repo system: a platform repo for product docs, OpenAPI contracts and infra, an Angular 20 / Nx front-end monorepo (storefront + admin apps), a Spring Boot 3 / Java 21 modular monolith, and a WordPress child theme for the marketing site and magazine.
- 02 Made the API contract-first: 27 OpenAPI 3.1 specs are the single boundary between front-end and back-end, with typed mocks so the UI and the API could be built and tested independently, plus RFC-7807 errors and integer-rial money end to end.
- 03 Built the storefront and admin dashboard in Angular 20 on Nx: standalone components, signals, OnPush everywhere, domain libs split into feature / ui / data-access layers with enforced boundaries, Persian RTL design system, Jest unit tests and Playwright E2E.
- 04 Designed the backend as a modular monolith (catalog, order, payment, wallet, auth, discount, KYC, provider, admin, telegram) with MySQL + Flyway (146 migrations), MongoDB for the flexible product catalog and Redis for OTP, rate limits and caching, covered by Testcontainers integration tests.
- 05 Integrated three payment gateways and two wholesale supplier APIs (catalog sync, automated order fulfillment, webhooks, provider ledger), SMS OTP login, and a Telegram bot that reuses the same domain services as the web checkout.
- 06 Built a multi-agent development pipeline with Claude Code: a PM agent turns the PRD into feature briefs, an architect agent turns a brief into a contract and per-repo tasks, and each repo runs dev → adversarial QA → code-review agents against written acceptance criteria. Every merge to production goes through my review.
- 07 Encoded engineering standards as guardrails the agents cannot skip: per-repo coding rules, Definition of Done gates (lint, tests, build), design-to-code checks against delivered HTML designs with Playwright screenshots, git hooks that block

direct pushes to production, and build-time guards for caching and JSON-LD safety.

- 08 Delivered about 115 features and 880+ tasks across the four repos in three months, at a pace a solo engineer could not reach without the pipeline, while keeping test coverage and contract parity enforced on every change.
- 09 Run production myself: Docker Compose on a single VPS, self-hosted GitHub Actions runners with deploy locking, TLS edge, ArvanCloud CDN, WP Super Cache, and a demo environment seeded from anonymized production data for rehearsing risky migrations.

Digipay

Senior Front-End Engineer

Dec 2021 – Present

Tehran

Angular

TypeScript

NX Monorepo

RxJS

Signals

- ▶ Lead the Credit & BNPL frontend — multi-step financial journeys in Angular + TypeScript that 10M+ people rely on every day.
 - ▶ Architected and shipped 14 shared npm packages, cutting cross-team duplication and accelerating delivery across every product line.
 - ▶ Set the technical direction for the Credit & BNPL line and mentor the engineers building it.
- 01 Migrated three standalone Angular applications (web-wallet, credit, merchant-credit) into a unified NX monorepo with shared libs/ structure, consolidating dependencies and enabling cross-app code reuse.
 - 02 Established a multi-layer testing strategy across 75 shared npm packages: Karma/Jasmine unit tests for signal-based component logic and OnPush behavioral contracts, Playwright E2E tests for computed CSS, animation, and input-variant contracts, and a dual snapshot system (style .txt + visual .png) as backward-compatibility guards.
 - 03 Engineered a 7-step credit pre-registration state machine with conditional step-skipping logic, BehaviorSubject-driven reactive state, dynamic plan filtering by fund provider and collateral type, and bidirectional URL-step synchronization via query parameters.
 - 04 Built zero-dependency pinch-to-zoom, pan, and double-tap gesture directives for document image inspection, implementing multi-touch distance calculation, boundary-constrained CSS transforms, and requestAnimationFrame-throttled magnifier with rotation-aware coordinate mapping.
 - 05 Designed a Claude AI-assisted test generation pipeline for a 75-package Angular component library, engineering a 900-line reusable prompt specification that encodes testing principles, Angular signal patterns, OnPush behavioral contracts, and Playwright pitfalls.
 - 06 Built a zero-maintenance test catalog CLI (generate-package-status.mjs) that auto-discovers unit and E2E specs across all 75 packages, counts individual test cases via regex, and generates a typed TypeScript data file powering a live status dashboard.
 - 07 Adopted Angular 17+ standalone components, OnPush change detection, and signal-based computed properties across the entire Credit/BNPL library, eliminating NgModule overhead.
 - 08 Implemented a custom Angular preloading strategy using route metadata (preload: true, critical: true) to load critical routes immediately post-bootstrap, alongside retryImport wrappers for network-resilient lazy module loading.
 - 09 Integrated multi-platform analytics (Google Tag Manager, InTrack, Sentry) behind a single EventManagementService abstraction, with Sentry configured for performance profiling and console-error capture.
 - 10 Built biometric identity verification feature with selfie video capture and liveness photo for digital document signing.
 - 11 Developed Mydigipay website by Laravel & Angular.

BACKEND CONTRIBUTIONS JAVA / SPRING BOOT · PHP

- ▶ Instrumented the Credit Onboarding Java (Spring Boot) service end-to-end with Micrometer metrics — campaign wallet creation, SMC scoring, ICS OTP (send / resend / verify), BNPL inquiry & allocation, sequential and volunteer activation flows.
- ▶ Fixed production Java bugs across microservices: NullPointerException in the blocking-detail service, journal double-linking on duplicate trackingCodes, and BNPL SMS double-activation — each covered with unit tests.
- ▶ Implemented a configurable time-window scoring-provider switch in the SMC Java service, enabling dynamic selection between ICS and BANK_SCORE engines on a scheduled basis.
- ▶ Built Credit Club (Mellat & Tejarat) and Installment Cheque landing pages in PHP on the Digipay marketing website, integrating credit-installment REST APIs.

Adowing

Front-End Developer

Oct 2019 – Dec 2021

Tehran

Vue Nuxt Agile

- 01 Developed internal panels for the marketing team, accounting team & other departments.
- 02 Built pixel-perfect UIs in different sizes according to the design.
- 03 Researched the agile approach with the product team and implemented it.
- 04 Researched test methods like unit test, integration test, regression test & acceptance test.
- 05 Researched clean code methods and developed products with them.
- 06 Mentored a front-end developer intern.

Carnotic

Front-End Developer

Oct 2019 - Dec 2021

Tehran

Nuxt SEO

- 01 Implemented a highly responsive user interface for a freight forwarding platform.
- 02 Built pixel-perfect UIs in different sizes according to the design.
- 03 Packed customized video player from "Talent Academy" project and used in Carnotic.
- 04 Implemented this Nuxt app for SEO purposes.
- 05 Documented components and wrote test cases for all methods.

Freelance

Android Developer

Oct 2014 - Oct 2015

Tehran

Android B4A

- 01 Developed 10 apps and published them in Cafebazaar, Myket and Candoo.
- 02 Implemented with B4A (Basic for Android) that is based on VisualBasic language.
- 03 All applications were content-driven.

02 PROJECTS

Pita

2024 - 2025 · Architect & Lead Frontend

Restaurant Kiosk + Kitchen Display System

React · NX Monorepo · WebSockets · Docker · TypeScript

A two-app React/NX monorepo for self-service restaurant ordering — a customer-facing kiosk and a kitchen display — sharing @pita/api and @pita/ui, deployed as separate Docker images behind nginx routing.

- 01 Integrated the Epson ePOS SDK for thermal receipt printing with automatic network → USB fallback, plus mobile-device and browser-print safety nets.
- 02 Real-time order sync between kiosk and kitchen over Laravel Echo + Pusher WebSockets, with a 10-second polling backup and a live in-process vs ready KDS board.
- 03 Zero-downtime version checker for always-on hardware — polls a cache-busted /version.json and forces a hard reload on new builds.

Pharma

2024 · Frontend Engineer

Prescription Drug E-commerce PWA

Angular 17 · PWA · Signals · Service Worker

A full Angular 17 PWA for prescription pharmaceutical e-commerce, built around a server-driven adaptive questionnaire engine with offline support.

- 01 Server-driven adaptive medical questionnaire (SingleChoice / MultipleChoice / FormFill / Terminate) — each question fetched from the API based on the previous answer for personalised eligibility screening.
- 02 Signal-based session management, CAPTCHA-protected auth, multi-step drug selection & checkout, in-app support chat, and a Service Worker for offline use.

ALSO SHIPPED

Talent Academy Vue · Custom video player

Interactive video player with playlists, instructor feedback messages, and global SSO for internal platforms.

Majid Angular · Complex JSON

Drag-and-drop, JotForm-style form builder — schema-driven UI with deep nested-JSON handling and live preview.

03 TOOLKIT

CORE Angular 5y · React / Next.js 4y · TypeScript 5y · NX Monorepo 3y

PROFICIENT

RxJS · Vue · Nuxt · Playwright · Jest · Karma/Jasmine · SCSS / Tailwind · PWA / Service Workers

BACKEND

Java / Spring Boot · MySQL · MongoDB · Redis · PHP

FAMILIAR

Docker · GitHub Actions · OpenAPI · WordPress · Technical SEO · Claude Code / AI agents · WebSockets · Git · Figma · Agile/Scrum
